

Experiment-3

Aim: To create table and process the big data in Hbase.

Require Software& Tools: Hadoop in Ubuntu, Hbase
steps for hbase

1. Open Ubuntu, open home folder and go to hbase-2.6.4/bin
2. Right click and open with terminal
3. Start hbase shell, type the following commands

a.start-hbase.sh

b.jps

c.hbase shell

Experiment:

1.To list the tables in hbase: list

2.Creating table in hbase

create 'customer','customer_info','customer_details'

3.To insert values into table:

put 'customer','1','customer_info:name','sita'

put 'customer','1','customer_info:age','25'

put 'customer','1','customer_details:mobile','9999999999'

4. To display the contents of the table

get 'customer','1'

5.To insert other values into table:

put 'customer','1','customer_details:email','sita@gmail.com'

6. To display the contents of the table

get 'customer','1'

7. To insert other row

put 'customer','2','customer_info:name','rama'

put 'customer','2','customer_details:mobile','9898999999'

put 'customer','2','customer_info:age','28'

put 'customer','2','customer_details:email','rama@gmail.com'

8.To update the details

put 'customer','1','customer_info:name','John' # Update name

put 'customer','1','customer_info:age','31' # Update age

scan customer;

10.To delete a specific column from a row

delete 'customer','1','customer_info:age'

11. Delete an entire row (all columns) from the table:

deleteall 'customer','1'
